

Wicket Blocks

Mexteds has extensive experience in new cricket block construction and renovation of existing blocks, where substandard surfaces can lead to poor performance.

Construction

Using specialised surveying equipment we are able to offer a full design service. We then employ laser technology during the excavation and construction phase to achieve the optimum playing surface, before sowing with a Combo 2000 sower.

Cut downs

Using our purpose-built planer and loading elevator, we are able to efficiently remove turf in areas such as contaminated cricket wickets and other sports field areas, leaving a perfect surface for the re-laying of new turf or dressing up for re-sowing.

Roto-grooving, sweeping and re-sowing

Mexteds' verticutter is used for pre-season thatch removal and sweeping and multi-directional grooving of wicket blocks prior to renovating and re-sowing.

Wicket clay supply

Mexteds specialises in the processing of wicket clays, transforming the raw material into a highly specialised product. The material is rotary hoed, dried and crushed prior to use in wicket block construction and renovation. We also supply wicket clays to local councils.
